Investment Strategy

ICM Small Company Portfolio seeks to achieve its objective by investing primarily in common stocks of companies that have market capitalizations within the market capitalization range of the Russell 2000 Value Index at the time of purchase. Typically, ICM invests in companies that have an above-average return on equity, are financially strong, and yet are selling at a price-to-earnings ratio lower than that of most stocks represented in the Russell 2000 Index. ICM believes stocks with such characteristics are likely to provide superior rates of return to investors when compared to stocks with higher price-to-earnings ratios over extended periods of time and through a variety of economic and market cycles.

Using screening parameters such as price-to-earnings ratios, relative return on equity, and other financial ratios, ICM screens the Portfolio's universe of potential investments to identify securities that ICM believes are undervalued. The list of candidates is narrowed further by the use of traditional fundamental security analysis, which may include interviews with company management and a review of the assessments and opinions of outside analysts and consultants.

The performance data quoted represents past performance. Past performance does not guarantee future results. The investment return and principal value of an investment will fluctuate so that an investor's shares when redeemed, may be worth more or less than their original cost and current performance may be lower or higher than the performance quoted.

For performance data current to the most recent month end, please call 1-866-234-5426 or visit our website at www.icomd.com. Mutual fund investing involves risk including loss of principal. In addition to the normal risks associated with equity investing, investments in smaller companies typically exhibit higher volatility. Index is unmanaged and not available for direct investment. The Russell 2000 Value Index measures the performance of those Russell 2000 companies with lower price-to-book ratios and lower forecasted growth values. Index returns assume reinvestment of dividends and do not reflect any fees or expenses. One cannot invest directly into an index.

¹The harmonic average is used when averaging ratios that may produce extreme results due to small relative numbers in the denominator, such as P/E, P/B, etc. The harmonic average by itself does not exclude extreme values (positive or negative), it simply reduces the impact of outliers on the aggregate calculation.
